The corresponding Dynkin diagram has *k*th vertex crossed.

There are many more (standard) parabolic subalgebras of \mathfrak{g} , obtained by crossing more than one vertex in the Dynkin diagram.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

There are many more (standard) parabolic subalgebras of \mathfrak{g} , obtained by crossing more than one vertex in the Dynkin diagram.

They consist of block upper triangular matrices with more than two blocks on the diagonal.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- There are many more (standard) parabolic subalgebras of \mathfrak{g} , obtained by crossing more than one vertex in the Dynkin diagram.
- They consist of block upper triangular matrices with more than two blocks on the diagonal.
- In particular, crossing all vertices we get the Borel subalgebra of upper triangular matrices.

We consider finite length \mathfrak{g} -modules M, such that

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

We consider finite length g-modules M, such that

 as an l-module, M decomposes into a direct sum of finite-dimensional irreducibles;

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

We consider finite length g-modules M, such that

 as an I-module, M decomposes into a direct sum of finite-dimensional irreducibles;

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• \mathfrak{u} acts locally nilpotently on M.

We consider finite length g-modules M, such that

- as an l-module, M decomposes into a direct sum of finite-dimensional irreducibles;
- \mathfrak{u} acts locally nilpotently on M.

Then M decomposes into a direct sum of modules with generalized infinitesimal character. So it is enough to study modules with (fixed) generalized infinitesimal character.

Let F_{λ} be the irreducible finite-dimensional I-module with highest weight $\lambda.$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Let F_{λ} be the irreducible finite-dimensional I-module with highest weight λ .

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Consider F_{λ} as a p-module, with \mathfrak{u} acting by 0.

Let F_{λ} be the irreducible finite-dimensional l-module with highest weight λ .

Consider F_{λ} as a p-module, with \mathfrak{u} acting by 0.

Construct $V_{\mathfrak{p}}(\lambda) = U(\mathfrak{g}) \otimes_{U(\mathfrak{p})} F_{\lambda} = U(\mathfrak{u}^{-}) \otimes F_{\lambda}$.

Let F_{λ} be the irreducible finite-dimensional l-module with highest weight λ .

Consider F_{λ} as a p-module, with \mathfrak{u} acting by 0.

Construct $V_{\mathfrak{p}}(\lambda) = U(\mathfrak{g}) \otimes_{U(\mathfrak{p})} F_{\lambda} = U(\mathfrak{u}^{-}) \otimes F_{\lambda}$.

The module $V_{\mathfrak{p}}(\lambda)$ has a unique maximal submodule. The quotient of $V_{\mathfrak{p}}(\lambda)$ by this submodule is irreducible. In this way one gets all irreducible objects of $\mathcal{O}_{\mathfrak{p}}$.

BGG stands for Bernstein-Gel'fand-Gel'fand.

BGG stands for Bernstein-Gel'fand-Gel'fand. Bruhat order on the Weyl group W:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

BGG stands for Bernstein-Gel'fand-Gel'fand.

Bruhat order on the Weyl group W:

Geometrically, elements of W parametrize orbits of B on G/B, and $w \le w'$ means the closure of Bw'B contains BwB.

BGG resolution of a finite-dimensional module F_{λ} : move the highest weight by ρ , or use *W*-action $w \cdot \lambda = w(\lambda + \rho) - \rho$.

In the Hasse diagram, replace each w by the Verma module $V_{\mathfrak{p}}(w\lambda)$. Every arrow gives a morphism in the opposite direction, unique up to scalar.

Add up over elements of each length, and add up the corresponding morphisms.

Hasse diagram: a graph with vertices $w \in W$ and arrows pointing towards each immediate successor.

BGG resolution of a finite-dimensional module F_{λ} : move the highest weight by ρ , or use *W*-action $w \cdot \lambda = w(\lambda + \rho) - \rho$.

In the Hasse diagram, replace each w by the Verma module $V_{\mathfrak{p}}(w\lambda)$. Every arrow gives a morphism in the opposite direction, unique up to scalar.

Add up over elements of each length, and add up the corresponding morphisms.

For a good choice of scalars (signs!), get a resolution of F_{λ} .

Enright and Shelton proved that the corresponding categories are equivalent.

In particular, one can obtain singular BGG resolutions from regular ones for $(\mathfrak{g}',\mathfrak{p}')$.

Our approach is to construct the resolutions more directly and more explicitly, using the Penrose transform, in the dual setting of homogeneous bundles and differential operators. In particular, we do not use Enright-Shelton equivalences.

Enright and Shelton proved that the corresponding categories are equivalent.

In particular, one can obtain singular BGG resolutions from regular ones for $(\mathfrak{g}', \mathfrak{p}')$.

Our approach is to construct the resolutions more directly and more explicitly, using the Penrose transform, in the dual setting of homogeneous bundles and differential operators. In particular, we do not use Enright-Shelton equivalences.

(By "more explicitly", I mean that the differential operators in the bundle setting are very explicit, which is useful for applications in parabolic geometry and makes it possible to pass to the "curved case".)

Passing to G-equivariant bundles

Recall that G-equivariant bundles on G/P are given as $G \times_P V$, where V is a representation of P.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Recall that G-equivariant bundles on G/P are given as $G \times_P V$, where V is a representation of P.

In particular, if V is the irreducible finite-dimensional representation F_{λ}^* , we denote the sheaf of holomorphic sections of the corresponding bundle by $\mathcal{O}_{\mathfrak{p}}(\lambda)$.

Recall that G-equivariant bundles on G/P are given as $G \times_P V$, where V is a representation of P.

In particular, if V is the irreducible finite-dimensional representation F_{λ}^* , we denote the sheaf of holomorphic sections of the corresponding bundle by $\mathcal{O}_{\mathfrak{p}}(\lambda)$.

One shows that the *G*-invariant differential operators between $\mathcal{O}_{\mathfrak{p}}(\lambda)$ and $\mathcal{O}_{\mathfrak{p}}(\mu)$ are in one-to-one correspondence with g-maps between Verma modules $V_{\mathfrak{p}}(\mu)$ and $V_{\mathfrak{p}}(\lambda)$.

In particular, BGG resolutions in the category $\mathcal{O}_{\mathfrak{p}}$ can be turned into resolutions of the corresponding sheaves, with differentials given by invariant differential operators.

Furthermore, the fibers of $\eta: Y \to Z$ are contractible.

In this situation, one can start with an \mathcal{O} -module \mathcal{S} on Z, and pull it back to Y (sheaf-theoretic, not \mathcal{O} -module pullback).

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

In this situation, one can start with an \mathcal{O} -module \mathcal{S} on Z, and pull it back to Y (sheaf-theoretic, not \mathcal{O} -module pullback).

It is easy to relate the cohomology of $\eta^{-1}S$ with the cohomology of S, since the fibers of η are contractible.

In this situation, one can start with an \mathcal{O} -module \mathcal{S} on Z, and pull it back to Y (sheaf-theoretic, not \mathcal{O} -module pullback).

It is easy to relate the cohomology of $\eta^{-1}S$ with the cohomology of S, since the fibers of η are contractible.

Now one resolves $\eta^{-1}S$ by locally free sheaves Δ^p , and pushes this resolution down to X by the derived direct image.

In this situation, one can start with an \mathcal{O} -module \mathcal{S} on Z, and pull it back to Y (sheaf-theoretic, not \mathcal{O} -module pullback).

It is easy to relate the cohomology of $\eta^{-1}S$ with the cohomology of S, since the fibers of η are contractible.

Now one resolves $\eta^{-1}S$ by locally free sheaves Δ^p , and pushes this resolution down to X by the derived direct image.

Then there is a "hypercohomology spectral sequence"

$$E_1^{pq} = \Gamma(X, \tau^q_* \Delta^p) \Rightarrow H^{p+q}(Z, \mathcal{S}).$$

In our situation, we take an integral λ which is singular for g, but regular for the Levi factor \mathfrak{l} of \mathfrak{p} . (λ is already ρ -shifted, so it corresponds to the infinitesimal character.)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

In our situation, we take an integral λ which is singular for g, but regular for the Levi factor l of p. (λ is already ρ -shifted, so it corresponds to the infinitesimal character.)

Since I is the product of two gI factors (of sizes $k \leq l$), the coordinates of λ can be repeated at most twice. Assume that there are j repeated coordinates $(j \leq k)$ and s non-repeated coordinates (2j + s = n + 1).

In our situation, we take an integral λ which is singular for g, but regular for the Levi factor l of p. (λ is already ρ -shifted, so it corresponds to the infinitesimal character.)

Since l is the product of two gl factors (of sizes $k \leq l$), the coordinates of λ can be repeated at most twice. Assume that there are j repeated coordinates ($j \leq k$) and s non-repeated coordinates (2j + s = n + 1).

We now choose Q with Levi $GL(j) \times GL(j+s)$. Then there is exactly one permutation $\overline{\lambda}$ of λ which is dominant and regular for the Levi of \mathfrak{q} ; the first group of coordinates must contain each of the repeated coordinates once.

We start with the homogeneous bundle $\mathcal{O}_{\mathfrak{q}}(\bar{\lambda})$ on G/Q, and restrict it to Z.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

We start with the homogeneous bundle $\mathcal{O}_{\mathfrak{q}}(\overline{\lambda})$ on G/Q, and restrict it to Z.

We pull this restriction back to Y and resolve it using the relative BGG resolution $\Delta^{p}(\lambda)$ with respect to the fiber. The part of λ corresponding to the fiber is regular, so this is essentially the BGG resolution of a finite-dimensional module.

We start with the homogeneous bundle $\mathcal{O}_{\mathfrak{q}}(\overline{\lambda})$ on G/Q, and restrict it to Z.

We pull this restriction back to Y and resolve it using the relative BGG resolution $\Delta^{p}(\lambda)$ with respect to the fiber. The part of λ corresponding to the fiber is regular, so this is essentially the BGG resolution of a finite-dimensional module.

The direct images of $\Delta^{p}(\lambda)$ can be computed explicitly using the Bott-Borel-Weil theorem. We show that the nonzero sheaves obtained in this way can be organized into a BGG resolution on G/P, corresponding to our singular λ .

Example

Consider the dominant weight (55432210). The relative BGG resolution has the form

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

(The arrows go right and down.)
Example

Now erase the first bar, and use Bott-Borel-Weil to obtain the direct images:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

(The numbers denote cohomology degree.)

 d_0 : the vertical differential of the Čech complex used to compute the Bott-Borel-Weil cohomology.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

 d_0 : the vertical differential of the Čech complex used to compute the Bott-Borel-Weil cohomology.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

 d_1 : the horizontal differential of the relative BGG resolution.

 d_0 : the vertical differential of the Čech complex used to compute the Bott-Borel-Weil cohomology.

 d_1 : the horizontal differential of the relative BGG resolution.

At every point of the Hasse diagram corresponding to the relative BGG resolution, d_1 has components $d_1^{(r)}$ in the directions of the arrows in the Hasse diagram emanating from that point.

Let [a] be a vertical (d_0-) cohomology class at a point of the above Hasse diagram.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Let [a] be a vertical (d_0-) cohomology class at a point of the above Hasse diagram.

Suppose that the next i - 1 points in some direction r from a have no cohomology (at any vertical place of the corresponding column).

Similarly, $d_i^{(r)} d_j^{(s)} a$ is constructed using a sequence on the left face, followed by a sequence on the back face.

We fix the sequences on the front and on the left face.

Proof - continued

One shows by diagram chasing that the sequence on the front face of the box can be pushed through the box in a zig-zag motion to the back face of the box, with all the sequences in between satisfying similar properties, and with the left ends following our chosen sequence on the left face.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Proof - continued

One shows by diagram chasing that the sequence on the front face of the box can be pushed through the box in a zig-zag motion to the back face of the box, with all the sequences in between satisfying similar properties, and with the left ends following our chosen sequence on the left face.

The sequence obtained on the back face, together with our sequence on the left face, computes $d_i^{(r)}d_j^{(s)}a$. The sequence of the right ends of the intermediate sequences, together with our sequence on the front face, computes $d_i^{(s)}d_i^{(r)}a$.

Proof - continued

One shows by diagram chasing that the sequence on the front face of the box can be pushed through the box in a zig-zag motion to the back face of the box, with all the sequences in between satisfying similar properties, and with the left ends following our chosen sequence on the left face.

The sequence obtained on the back face, together with our sequence on the left face, computes $d_i^{(r)}d_j^{(s)}a$. The sequence of the right ends of the intermediate sequences, together with our sequence on the front face, computes $d_i^{(s)}d_i^{(r)}a$.

It follows from the construction that $d_i^{(r)}d_j^{(s)}a$ equals $d_j^{(s)}d_i^{(r)}a$ except for a minus sign. This proves the proposition.

It remains to see that our singular BGG complex is exact except in degree 0, so we have obtained a resolution of the kernel of the first differential operator in the complex.

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

It remains to see that our singular BGG complex is exact except in degree 0, so we have obtained a resolution of the kernel of the first differential operator in the complex.

Recall the double fibration

It remains to see that our singular BGG complex is exact except in degree 0, so we have obtained a resolution of the kernel of the first differential operator in the complex.

Recall the double fibration

Recall also the hypercohomology spectral sequence:

It remains to see that our singular BGG complex is exact except in degree 0, so we have obtained a resolution of the kernel of the first differential operator in the complex.

Recall the double fibration

Recall also the hypercohomology spectral sequence:

$$E_1^{pq} = \Gamma(X, \tau^q_*\Delta^p(\lambda)) \Rightarrow E_\infty^{pq} = H^{p+q}(Z, \mathcal{O}_\mathfrak{p}(\lambda)).$$

By construction, passing through this spectral sequence gives exactly the global sections of the cohomology of our singular BGG complex, with a shift in degree.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

By construction, passing through this spectral sequence gives exactly the global sections of the cohomology of our singular BGG complex, with a shift in degree.

The shift in degree comes from the fact that the degree 0 point in our singular BGG complex is of degree p inside the relative BGG resolution, and has vertical degree q (specified by the number written over the point), where p + q = j(k - j).

By construction, passing through this spectral sequence gives exactly the global sections of the cohomology of our singular BGG complex, with a shift in degree.

The shift in degree comes from the fact that the degree 0 point in our singular BGG complex is of degree p inside the relative BGG resolution, and has vertical degree q (specified by the number written over the point), where p + q = j(k - j).

Since X is Stein, taking global sections commutes with taking cohomology of a complex. So it is enough to see that E_{∞}^{pq} vanishes in the degrees above j(k - j). (Recall that the Levi of P is $GL(k) \times GL(l)$, while the Levi of Q is $GL(j) \times GL(j + s)$.)

To prove the required vanishing, we first show that Z can be fibered over the Grassmanian Gr(j, k) of *j*-planes in \mathbb{C}^k , with Stein fibers.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

To prove the required vanishing, we first show that Z can be fibered over the Grassmanian Gr(j, k) of *j*-planes in \mathbb{C}^k , with Stein fibers.

So the cohomology of holomorphic sheaves on Z will vanish above degree j(k - j) if we can prove vanishing of the cohomology of holomorphic sheaves on Gr(j, k) above degree $j(k - j) = \dim Gr(j, k)$.

To prove the required vanishing, we first show that Z can be fibered over the Grassmanian Gr(j, k) of *j*-planes in \mathbb{C}^k , with Stein fibers.

So the cohomology of holomorphic sheaves on Z will vanish above degree j(k - j) if we can prove vanishing of the cohomology of holomorphic sheaves on Gr(j, k) above degree $j(k - j) = \dim Gr(j, k)$.

We prove the last statement by covering Gr(j, k) by j(k - j) + 1 open Stein sets.
